For Immediate Release

Bear Onsite, LLC & Jackel, Inc. Announce Strategic Alliance for New Series of Filtered Basin Assemblies

Bear Onsite, LLC of Somerville, Tennessee and Jackel, Inc. of Mishawaka, Indiana, have entered into a strategic alliance to bring the onsite market a new series of high performance filtered basin assemblies, under the new brand name BEAR-JACK.™ These six filtered basin assemblies meet a variety of water filtration needs such as rainwater harvesting, sanitary wastewater filtration, and tertiary filtration following secondary treatment units.

“While other companies increase their product offerings through acquisitions, Bear Onsite prefers to align with another company like Jackel, that shares the same commitment to quality”, Terry commented. Considering Jackel’s history of more than 2.5 million structural foam basin installations since 1980, without a single report of a collapsed sidewall, the decision to partner with them in the new BEAR-JACK™ filter basin assembly was easy, Terry said.

Craig Nowicki, Jackel President, concurs. “When our customers asked us to package an effluent filter with our basins, we knew it would have to be a filter and a company that adhered to our same high standards,” Nowicki said. “When we looked at Terry’s 20-plus years of onsite

experience working with effluent filters, first as a regulator specifying their usage, then as an inventor of effluent filters for companies such as Zabel Environmental Technology, BEST Technology, Ring Industrial Group and now his own company, Bear Onsite, the choice became clear.”

The new BEAR-JACK™ filtered basin assemblies will be available through both Bear Onsite and Jackel. For more information about these quality products, visit their respective websites at www.bearonsite.com and www.jackelinc.com.
